                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PT DNA encoding proteins which can be incorporated with wild type routeloospsid subunit(s) into a viral nucleocapsid - useful for proteins which replication, especially hepatitis B virus plsclosure; Page 41-42; 60pp; English.

CC This is the 21 kDa (p21) protein of hepatitis B virus (HBV) that cassembled into a 180 kSa subunit nucleocapsid structure that promotes viral replication. Evidence is provided that HBV replication is inhibited in the presence of high levels of HBV replication is inhibited in the presence of high levels of HBV replication into HBV nucleocapsids along with the p21 core protein and thereby render the nucleocapsids along with the p21 core protein card thereby render the nucleocapsids deficient in encapsidating HBV regenemic RNA. Thus, over-expression of the precore protein or certain variants of them, leads to transdominant inhibition of HBV replication. Suitable inhibitory proteins include p25 (see w50250), p22 (see w50231) and wet-p12 (see w50242), p18 (see w50235), wet-p18 (see w50237) and wet-p18-het (see w50232). These proteins can be produced by recombinant methods using claimed expression construct that directs overexpression of an inhibitory protein in target cells is used for the gene therapy of HBV infection.

Converse of the produced by recombinant methods using claimed expression of cells cacid construct that directs overexpression of an inhibitory protein in target cells is used for the gene therapy of HBV infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PT DNA encoding proteins which can be incorporated with wild type protein proteins which a viral nucleocapsid - useful for nucleocapsid subunit(s) into a viral nucleocapsid - useful for protein that is produced by elimination of the 19-amino acid leader CC This polypeptide comprises the hepatitis B virus (HBV) 22 kDa (p22) CC protein that is produced by elimination of the 19-amino acid leader CC w50250). Evidence is provided that HBV precore protein (see CC w50250). Evidence is provided that HBV replication is inhibited in CC the presence of high levels of HBV precore or precore-related CC proteins. These proteins can be incorporated into HBV nucleocapsids CC along with the p21 core protein (see w50251), which is the usual CC uncleocapsid component, and thereby render the nucleocapsids CC deficient in encapsidating HBV pregenomic RNA. Thus, over-cxpression of the precore proteins, or certain variants of them, CC leads to transdominant inhibition of HBV replication. Suitable CC inhibitory proteins include p25 (see w50250), p22, Met-p22 (see W50242), p18 (see w50236), Met-p18 (see W50237) and Met-p21 (see W50244-49) may be consisted into the p22 and Met-p22 (see W50244-49) may be consisted into the p22 and Met-p22 (see W50244-49) may be consisted into the p22 and Met-p22 (see W50244-49) may be consisted into the p25 or use in inhibiting HBV replication. CC Alternatively, a nucleic acid construct that directs overexpression cc therapy of HBV infection.

Alteration of the C-terminus of the core protein (W09044) of hepatitis B virus (HBV) or other hepadnavirus creates a mutant polypeptide capable of reducing replication of the wild-type virus by a dominant negative mechanism. The inhibitory effect is species-specific and is achieved by deletion of a few C-terminal amino acids from the core protein, and/or by joining the core protein to a hepadnavirus surface protein (see also W09045), creating a core-surface fusion. Such mutant polypeptides (see also W09046-50) can be used to treat hepadnavirus, e.g. HBV,

PT Recombinant DNA encoding Hepatitis B virus polypeptide antigens -

PT used in detection of infection and in vaccine prodn.

PS Disclosure; 4pp; English.

CC Polypeptide fragments encoded by the DNA sequence are antigenic for

CC Polypeptide fragments encoded by the DNA sequence may be used as a vaccine or in detection. Peptides may be

CC cultured in a suitable bacterial host such as E.coli.

                                                                                           Recombinant DNA coding for polypeptide - have specificity of hepatitis B viral antigens in detection or antibody stimulation Example; Figs 3-4; 43pp; English.

Human serum from a single HBsAp positive, HBsAp positive donor (serotype adym) was used to prep. a DNA-contq. pellet which was labelled with 3H or 32P as described by P. M. Kaplan et al (1973). The labelled DNA was then extracted with phenol from the resulting pellet using the procedure of L. Lutwick and W. S. Robinson (1977). It was then cloned in plasmid pBR322 which was used to transform E. coli. Micro-organisms prepd. by the processes are deposited at the NCIB as pBR32-HBV-G-L, e.g. E. coli HB101/pBR322-Pst I dG: TetR AmpS HBV+.

                                                                                                                                                                                                                                                                                                                                                 Plasmid PHBV DN AA carries an insert (749598) coding for a prot (W09048) comprising a hepatitis B virus (HBV) core protein (see also W09045) at amino acid 179 with the HBV surf protein (see also W09045) at amino acid 8. Plasmid PHBV DN BB (749599) expresses the HBV core fused at amino acid 175 to the surface protein at amino acid 112 (W09049). HBV DN AA was at least as potent an inhibitor of HBV replication as construct PHBV DN (749597); PHBV DN BB was less inhibitory than PHBV DN. Vectors expressing hepadnavirus dominant negative core mutants be utilised in the gene therapy of viral infections.

Sequence 397 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-PSDB: T49598.

New method for inhibiting the replication of hepadnaviruses - comprises introducing a mutant polypeptide with a mutated core protein or corresponding nucleic acid, for treating, e.g. hepatitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 46-48; 83pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Key

                                                                                                                                                                                                                                                                                                              R40806;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant DNA coding for polypeptide - have specificity of hepatitis B viral antigens in detection or antibody stimulation Claim 13; Page 40; 43pp; English.

Human serum from a single HBsAg positive, HBeAg positive donor (serotype adym) was used to prep. a DNA-contg. pellet which was labelled with 3H or 32p as described by p. M. Kaplan et al (1973). The labelled DNA was then extracted with phenol from the resulting pellet using the procedure of L. I. Lutwick and W. S. Robinson (1977). It was then cloned in plasmid pBR322 which was used to transform E. coli. Micro-organisms prepd. by the processes are deposited at the NCIB as pBR32-HBV-G-L, e.g. E. coli HB101/pBR322-Pst I dG: HBV-KPN I dC: Tetk AmpS HBV+.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA used in prevention of infections by hepatitis virus B - comprises structural gene of hepatitis virus adr B surface antigen coding gene and at least 1 virus core antigen structural gene. Disclosure: Fig 3; 13pp; Japanese.

The sequence is that of hepatitis virus core antigen (HBcAg). It can be used as a vaccine for the prevention of infections by hepatitis B virus (HBV) and also in the diagnosis of early stages of HBV infection. See also p40310.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Run on: Thu Dec 16 13:49:26 1999; MasPar time 10.05 Seconds 829.670 Million cell updates/sec

Title:

Description: Perfect Score: Sequence: >US3890-10-38183 (1-295) from us3890-10-38183.pep 2205 1 MDIDPYKEFGATVELLSFLP......RRRRSQSPRRRRSQSRESQC 295

Searched: PAM 150 Gap 11 77977 seqs, 28268293 residues

Scoring table:

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot37 1:swissprot

Statistics: Mean 48.376; Variance 105.353; scale 0.459

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Thu Dec 16 13:50:17 1999; MasPar time 20.79 Seconds 774.478 Million cell updates/sec

Tabular output not generated.

Title:

Description: Perfect Score: Sequence: >US3890-10-38183 (1-295) from us3890-10-38183.pep 2205 1 MDIDPYKEFGATVELLSFLP......RRRRSQSPRRRRSQSRESQC 295

Scoring table: PAM 150 Gap 11

Searched: 179066 seqs, 54579741 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: sptremb19

1:sp_archea 2:sp_bacteria 3:sp_fung1 4:sp_human 5:sp_invertebrate 6:sp_mamma1 7:sp_mhc 8:sp_organelle 9:sp_phage 10:sp_plant 11:sp_rodent 12:sp_unclassified 13:sp_vertebrate 14:sp_virus

Statistics: Mean 46.681; Variance 107.222; scale 0.435

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
